"Identification of a Drosophila melanogaster gluentification of a Drosophila melanogaster gluentification of the antiparasitic agent av.

Channel sensitive to the antiparasitic agent av.

J. Biol. Chem. 271:20187-20191(1996).

                                                      protein and polynucleotides are useful for diagnosing and treating disorders related to ataxia. Ataxia gene sequences are useful in gene therapy, and as diagnostic tools or reagents for identifying a characterizing genetic defect involved in the disorders and disease related to ataxia.
                                                                                                                                            Claim

gamma-aminobutyric acid; OmpF; glycine;

Prepn. of N-terminal extracellular site protein - by culturi E.coli transformed by a plasmid comprising the tac promoter. culturing romoter, ribosome

Ş 밁 δÃ B οy 뭐 Š 밁 Š

Ş

The sequence given is the gamma-aminobutyric acid (GABA) A receptor beta-subunit. This sequence is used in an expression plasmid operably linked to the tac promoter, a ribosome binding sequence, the E. coli outer, membrane protein Ompr signal peptide coding sequence and a sequence coding for the N-terminal extracellular site of either the gamma-aminobutyric acid (GABA) A receptor alpha-subunit or the glycine receptor alpha-subunit. This expression plasmid can be used to transform E. coli to produce an N-terminal extracellular site protein of ion channel direct binding type receptor.

The ataxia protein and polynucleotides are useful for diagnosing and treating disorders related to ataxia. Ataxia gene sequences are useful in gene therapy, and as diagnostic tools or reagents for identifying an characterizing genetic defect involved in the disorders and diseases
